

# **DATABASE FOR A RETAIL ORGANIZATION**

Submitted by : **BHAVIKA BAGARIA**  
NUID : **001825309**

**INFO6210: DATA MANAGEMENT AND DATABASE DESIGN**

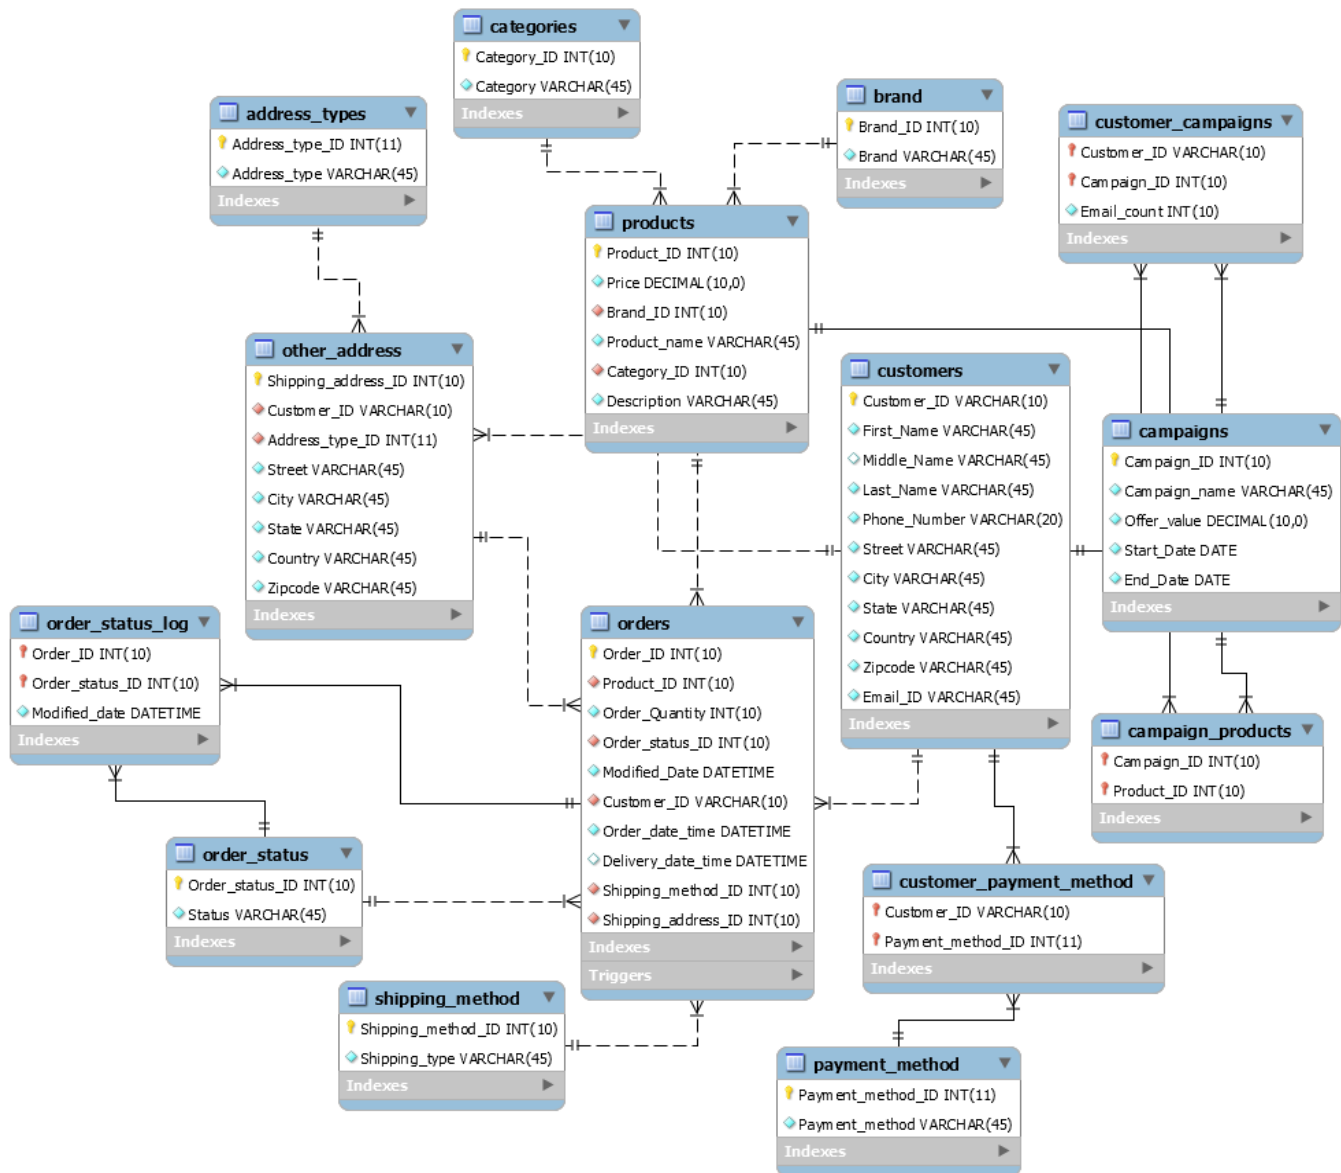

## **SUMMARY:**

The aim of the project is to build a database for a retail organization which has online sales. Different products of different brands are being sold and the customer is given options to make payment using different methods. Also, different coupons with offer values are sent out to specific customers and a track of the number of customers participating in those specific campaigns is stored. In the end, we find out which is the highest selling brand out of the given orders.

## **BUSINESS REQUIREMENTS:**

- Managing an online retail organization's database that sells various products of different brands.
- The shipping date and delivery date of the orders are tracked and stored in a log.
- Different products are grouped in categories and the products are linked to a particular brand.
- One customer can have more than one payment method and can have different shipping address and billing address.
- Different customer campaigns are introduced and the count of the Emails being sent out is stored.
- Also, based on the order records stored in the database the most bought brand by the customers is analyzed.

## ENTITY-RELATIONSHIP DIAGRAM:

This diagram represents all the tables involved from placing the order to the order being delivered.

**TRIGGERS:**

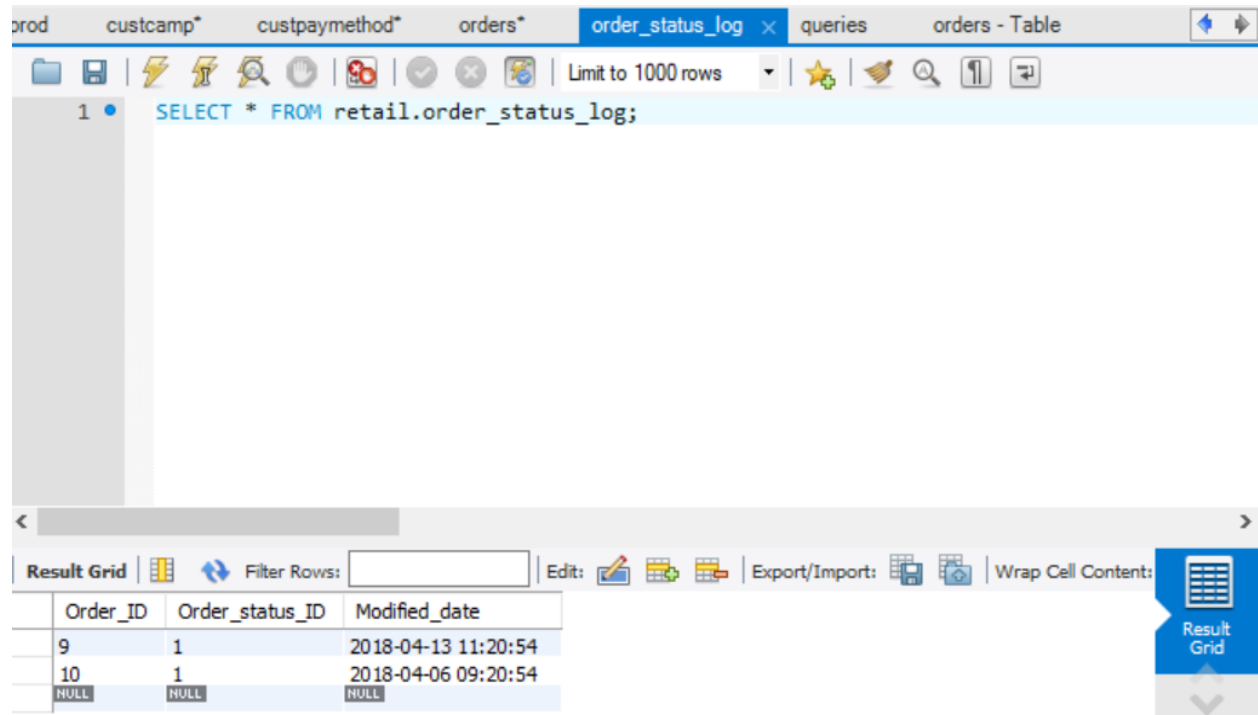

- In this database, two triggers are created. One trigger is used AFTER inserting the records and another one is used AFTER updating the records.
- These changes are triggered to be shown in another table which is the customer log table.

**AFTER INSERT TRIGGER:****Query:**

```
CREATE DEFINER=`root`@`localhost` TRIGGER `retail`.`orders_AFTER_INSERT`
AFTER INSERT ON `orders` FOR EACH ROW
BEGIN
INSERT INTO order_status_log VALUES(new.Order_ID, new.Order_status_ID,
new.Modified_date);
END

insert into orders(Order_ID, Product_ID, Order_Quantity, Order_Status_ID,
Modified_Date, Customer_ID, Order_date_time, Delivery_date_time,
Shipping_method_ID, Shipping_address_ID)
values (10,12, 6, 1, '2018-04-06 09:20:54', 'C111', '2018-04-15 12:15:45',
NULL, 2003, 2);
```

As mentioned above, the **AFTER INSERT** trigger is placed in the orders table and the order attributes are updated. The trigger runs and the output of this query appears in the order status log table.

**AFTER INSERT TRIGGER:****Output:**

The screenshot shows a database management tool interface. At the top, there are tabs for 'prod', 'custcamp\*', 'custpaymethod\*', 'orders\*', 'order\_status\_log' (selected), 'queries', and 'orders - Table'. Below the tabs is a toolbar with various icons. The main area displays a SQL query: `SELECT * FROM retail.order_status_log;`. Below the query, there is a 'Result Grid' section. It includes a 'Filter Rows' input field, an 'Edit' button, an 'Export/Import' button, and a 'Wrap Cell Content' button. The 'Result Grid' itself contains a table with three columns: 'Order\_ID', 'Order\_status\_ID', and 'Modified\_date'. The table has three rows: the first row has values 9, 1, and 2018-04-13 11:20:54; the second row has values 10, 1, and 2018-04-06 09:20:54; the third row has NULL values for all three columns.

Order_ID	Order_status_ID	Modified_date
9	1	2018-04-13 11:20:54
10	1	2018-04-06 09:20:54
NULL	NULL	NULL

**AFTER UPDATE TRIGGER:**

```

CREATE DEFINER=`root`@`localhost` TRIGGER `retail`.`orders_AFTER_UPDATE`
AFTER UPDATE ON `orders` FOR EACH ROW
BEGIN
INSERT INTO order_status_log VALUES(new.Order_ID, new.Order_status_ID,
new.Modified_date);
END

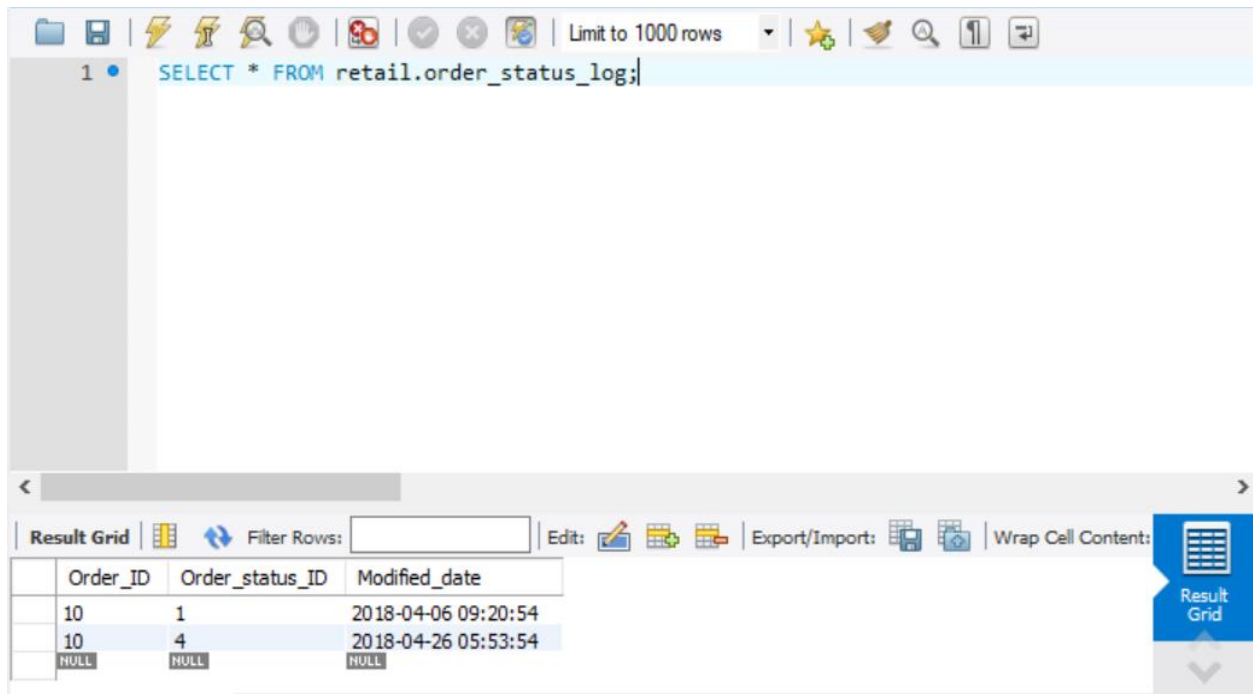

```

```
UPDATE orders
SET Order_status_ID= 4, Modified_Date = current_timestamp()
WHERE Order_ID=10;
```

Here, once the **AFTER UPDATE** trigger is given in the orders table, the update query is written with changes in the order status ID. Once this query runs successfully, the changes are updated in the order status log.

### **AFTER UPDATE TRIGGER:**

#### **Output:**

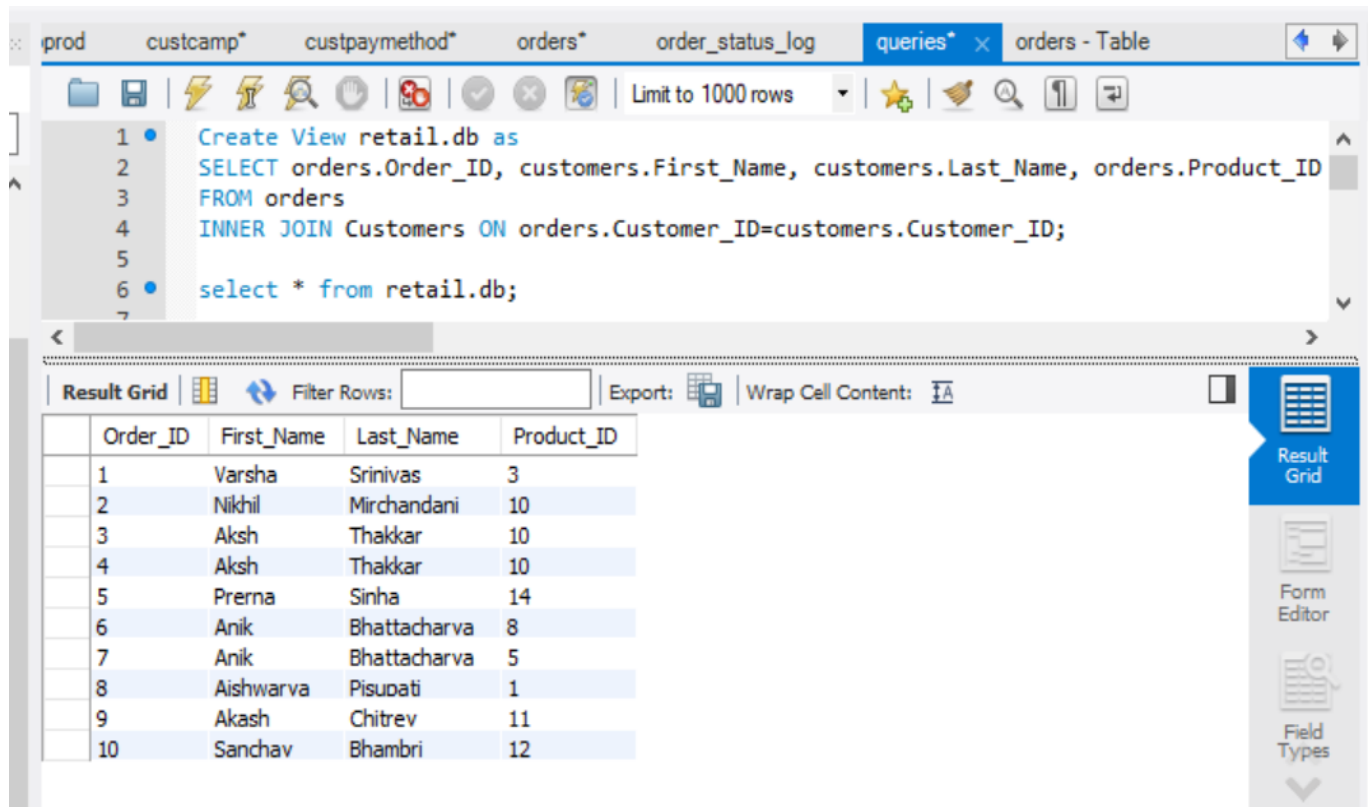

1 • SELECT \* FROM retail.order\_status\_log;

Order_ID	Order_status_ID	Modified_date
10	1	2018-04-06 09:20:54
10	4	2018-04-26 05:53:54
NULL	NULL	NULL

Here the two values in the result grid represent the changes made in the order status ID, 1 being order placed and 4 being the order is in transit.

The date and time is also mentioned for the convenience of the customer.

## CREATING AN INNER JOIN IN A VIEW:

The screenshot shows a database query editor with the following SQL code:

```

1 • Create View retail.db as
2 SELECT orders.Order_ID, customers.First_Name, customers.Last_Name, orders.Product_ID
3 FROM orders
4 INNER JOIN Customers ON orders.Customer_ID=customers.Customer_ID;
5
6 • select * from retail.db;
7

```

The results are displayed in a table with the following columns: Order\_ID, First\_Name, Last\_Name, and Product\_ID.

Order_ID	First_Name	Last_Name	Product_ID
1	Varsha	Srinivas	3
2	Nikhil	Mirchandani	10
3	Aksh	Thakkar	10
4	Aksh	Thakkar	10
5	Purna	Sinha	14
6	Anik	Bhattacharva	8
7	Anik	Bhattacharva	5
8	Aishwarva	Pisupati	1
9	Akash	Chitrev	11
10	Sanchav	Bhambri	12

An inner join is created to view which items are being ordered by different customers.

The join is created within a view and the view name is called to view the result of the above written query. A view is used here instead of stored procedure as the data can be fetched from the database without having to call the query multiple times.

## **CREATING A PROCEDURE TO FIND OUT THE NUMBER OF CUSTOMERS PARTICIPATING IN A CAMPAIGN:**

```
7
8  delimiter $$
9  • create procedure camp_cus_count(CampaignID int)
10  • begin
11  •   select count(*) as count from customer_campaigns where Campaign_ID= CampaignID;
12  • end $$
13  delimiter ;
14
15  • call camp_cus_count(001);
16
17
18
```

Result Grid

count
3

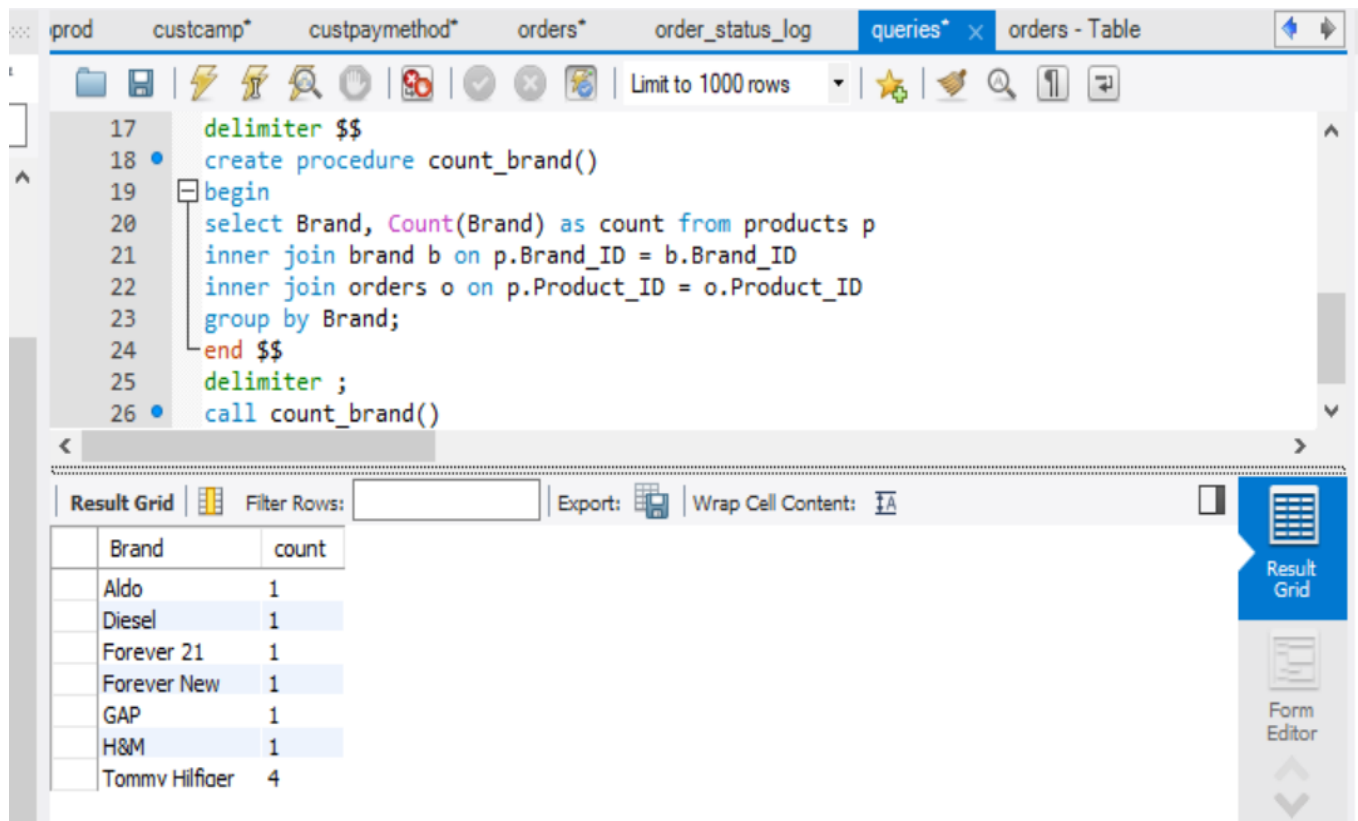

Export: Wrap Cell Content:

Result Grid

A stored procedure is written to execute a query which will give the value of the customers participating in a particular campaign. Here the number 001 refers to the campaign.

## **WRITING A QUERY TO FIND OUT THE MOST BOUGHT BRAND FROM THE LIST OF ORDERS:**

The screenshot shows a database query editor with a toolbar at the top. The toolbar includes icons for file operations, execution, and a 'Limit to 1000 rows' dropdown. The editor displays a SQL script for creating and calling a stored procedure named `count_brand()`. The script uses inner joins to connect the `products`, `brand`, and `orders` tables, and a `group by` clause to count the number of orders per brand.

```

17 delimiter $$
18 create procedure count_brand()
19 begin
20   select Brand, Count(Brand) as count from products p
21   inner join brand b on p.Brand_ID = b.Brand_ID
22   inner join orders o on p.Product_ID = o.Product_ID
23   group by Brand;
24 end $$
25 delimiter ;
26 call count_brand()

```

Below the script, the 'Result Grid' is displayed, showing the output of the query. The grid has two columns: 'Brand' and 'count'. The results are as follows:

Brand	count
Aldo	1
Diesel	1
Forever 21	1
Forever New	1
GAP	1
H&M	1
Tommv Hilfoer	4

A stored procedure is created to select the brand that has the maximum sales under different categories. Inner joins are used to join the brand and order tables thereby displaying a count of all the brands placed in the orders. To display the result of the query, the particular stored procedure is called.

## **CONCLUSION:**

Thus, a few of the queries are executed and explained to demonstrate the working of the database. A track of the order status log is maintained using triggers and a sample analytics of the orders records was performed by finding out the most bought brand of products.

**APPENDIX:****ATTACHING THE MySQL DUMP FILE:**

```
CREATE DATABASE IF NOT EXISTS `retail` /*!40100 DEFAULT CHARACTER SET utf8
